ShockLine™ Modular Vector Network Analyzers

MS46131A

1 MHz to 43.5 GHz

SHOCKLINE™

Introduction

The MS46131A is part of the ShockLine™ family of Vector Network Analyzers from Anritsu. It is a modular 1-port VNA that is configurable as single or dual 1-port VNAs, or as a fully reversing vector 2-port VNA with optional PhaseLync™ technology. The MS46131A is available in three frequency ranges: 1 MHz to 8/20/43.5 GHz, and is capable of S-parameter and time domain measurements.

The 1-port MS46131A is based on patented ShockLine™ VNA-on-chip technology, which simplifies the internal VNA architecture at high frequencies, reduces instrument cost, and enhances accuracy and measurement repeatability. The combination of low cost and good performance make ShockLine™ VNAs ideal candidates for testing 1-port RF and Microwave passive devices to 43.5 GHz.

The patent-pending PhaseLync option enables two MS46131A VNAs to phase synchronize enabling full 2-port S-parameter measurements on passive RF and Microwave devices. The option supports synchronization between two MS46131A VNAs to distances of 100 meters or greater, enabling this configuration to address applications where vector transmission measurements over distance is required.

The MS46131A series is controlled through USB from an external PC. The MS46131A runs the same software as the rest of the ShockLine family, providing a powerful graphical user interface for debugging and manual testing of devices, as well as command syntax that is compatible across the ShockLine VNA family for comprehensive remote control programming.

This document provides detailed specifications for the MS46131A series Vector Network Analyzers and related options.

Measurement Uncertainties

The graphs give measurement uncertainties after the above error-corrected calibration. The errors are a worst-case contribution of residual directivity, load and source match, frequency response and isolation, network analyzer dynamic accuracy, and connector repeatability. 10 Hz IF Bandwidth is used. For transmission uncertainties, it is assumed that S11 = S22 = 0. A nominal amount of time drift is included in the computation as is consistent with the use of phase compensation mode. Without phase compensation, uncertainties hold, but for a shorter amount of time/temperature change after calibration. For reflection uncertainties, it is assumed that $S_{21} = S_{12} = 0$. All calibrations and measurements were performed at default port power. 	Use the Anritsu calibration kit USB memory device to load kit coefficients and characterization files. Enter coefficients into user-defined locations. Use complex load models.
Interpolation	Allows interpolation between calibration frequency points.
Adapter Removal Calibration	Characterizes and “removes” an adapter that is used during calibration that will not be used for subsequent device measurements; for accurate measurement of non-insertable devices.
Dispersion Compensation	Selectable as Coaxial, other non-dispersive (e.g., for coplanar waveguide), Waveguide, or Microstrip
Embedding/De-embedding	The MS46131A is equipped with an Embedding/De-embedding system.
De-embedding	De-embedding is generally used for removal of test fixture contributions, modeled networks, and other networks described by S-parameters (s2p files) from measurements.
Embedding	Similarly, the Embedding function can be used to simulate matching circuits for optimizing amplifier designs or simply adding effects of a known structure to a measurement.
Multiple Networks	Multiple networks can be embedded/de-embedded and changing the port and network orientations is handled easily.
Extraction Utility	An extraction utility is part of this package that allows easier computation of de-embedding files based on additional calibration steps and measurements.
Impedance Conversion	Allows entry of different reference impedances (complex values) for different ports

Optional Capabilities

Time Domain Measurements, Option 002	Displays all S-parameters and overlays with Frequency Domain, Low-pass Mode with added harmonics frequency list flexibility, Band-pass Mode, Phasor Impulse Mode, Windowing, Gating (pass-band or reject-band), and Frequency with Time Gate.
PhaseLync, Option 012	Provides phase synchronization between two MS46131A VNAs enabling full 2-port vector S-parameter measurements.

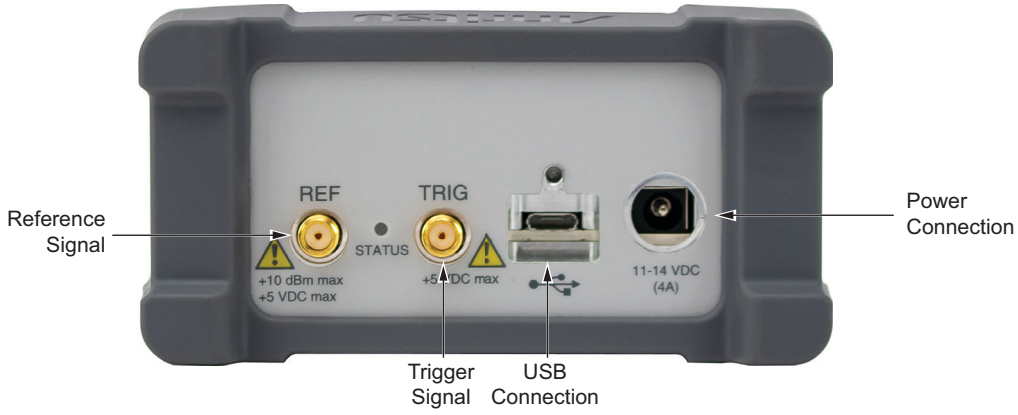
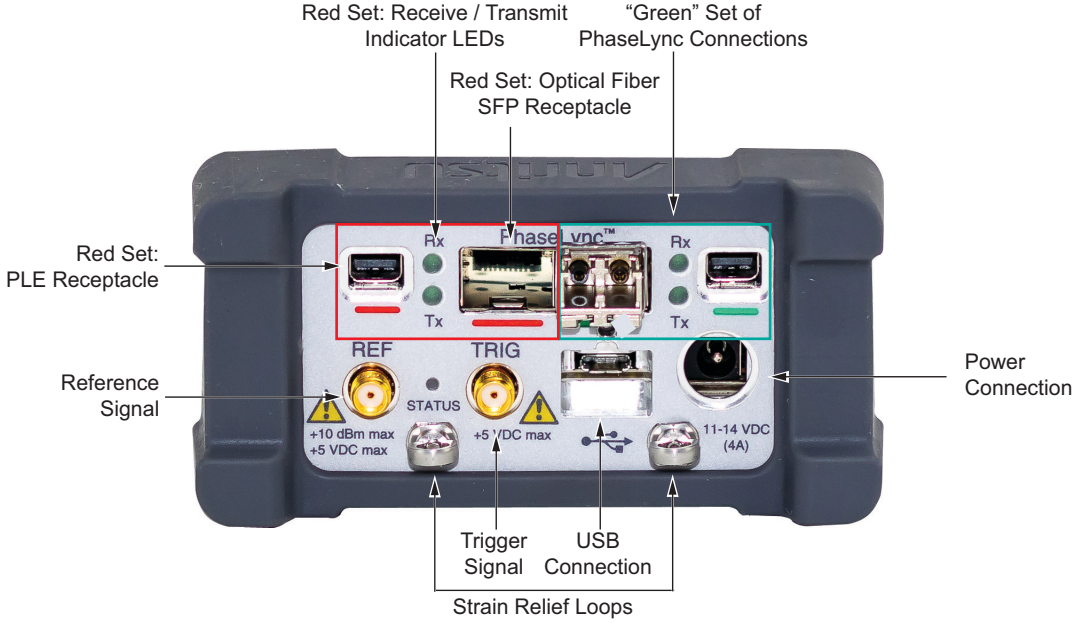
MS46131A Bottom Panel without PhaseLync Option



MS46131A Bottom Panel with PhaseLync Option



PhaseLync connections are paired up - green or red (matches the color of the end of the PhaseLync cable. Either one can be used, so there is not a "first" set and a "second" set of connections.

The importance of the pairing is that the system requires one of the pair of MS46131As to use the red while the other uses the green to function correctly. Using red-red or green-green will cause an error.

Only 1 SFP is installed, which may be moved between the red and green receptacles.

Recommended External PC Configuration

CPU	Intel® Core™ i5-6300U Processor
RAM	4 GB
Disk	120 GB
DirectX	Version 9 with Windows Display Driver Model (WDDM) installed

USB	One USB 2.0 (or higher) type A port per MS46131A used
	To increase the number of USB ports available, an externally powered USB hub may also be used.
