## Definitions and Conditions

## Specification (spec)

Specifications represent warranted performance of a calibrated instrument that has been stored for a minimum of 2 hours within the operating temperature range of 0 to $40^{\circ} \mathrm{C}$, unless otherwise stated, and after a 45-minute warm-up period. All Specifications apply over a $20^{\circ} \mathrm{C}$ to $30^{\circ} \mathrm{C}$ temperature range (unless otherwise stated). Specifications include guard bands to account for the expected statistical performance distribution, measurement uncertainties, and changes in performance due to environmental conditions. Data represented in this document are Specifications unless otherwise noted.

## Typical (typ)

Typical describes additional product performance information that is not covered by the product warranty. It is performance beyond specifications that 80 percent of the units exhibit with a 90 percent confidence level at room temperature (approximately $23^{\circ} \mathrm{C}$ ). Typical performance does not include measurement uncertainty.

## Nominal (nom)

Nominal values indicate the expected mean or average performance, or an attribute whose performance is by design, such as the 50 -ohm connector. This data is not warranted and is measured at room temperature (approximately $23^{\circ} \mathrm{C}$ ).

## Measured (meas)

Measured describes an attribute measured during the design phase for purposes of communicating expected performance, such as amplitude drift vs. time. This data is not warranted and is measured at room temperature (approximately $23^{\circ} \mathrm{C}$ ).

[^7]:    ${ }^{11}$ Offset only specified when frequency option F32 or F44 is present

[^8]:    ${ }^{12}$ The IF filter cut off is 10.5 GHz when upconverting above 19.5 GHz . When above 19.5 GHz and center frequency $\mathrm{f}<28.5 \mathrm{GHz}$, the IF is $\frac{f}{3}$. For $\mathrm{f} \geq 28.5 \mathrm{GHz}$, the IF is $\frac{\mathrm{f}}{5}$. Therefore, modulation bandwidth is limited by how close $\frac{\mathrm{f}}{3}$ or $\frac{\mathrm{f}}{5}$ is to the cutoff of 10.5 GHz IF filter. For example, at 21 GHz , the IF is centered at $\frac{21}{3}=7 \mathrm{GHz}$, which provides 3.5 GHz overhead since $10.5-7=3.5$.
